CONTROLLING CONTAMINATION ON SITE

Avoid contamination of stormwater with sediment. Use diversion devices to reduce the volume of stormwater reaching the disturbed area. On compact urban sites avoid overland flow through the work area by installing the final stormwater drainage system as early as possible in the construction process. Before installation of the final stormwater system, install an up-slope perimeter bank and catch drain connected to a temporary drop pipe, to take uncontaminated stormwater directly to the stormwater system. On steep sites, line catch drains with turf or geotextile fabric.

Uncontaminated stormwater from the channel should discharge to the stormwater system. In some cases discharge onto non-erodable areas of land is permissible. Check with your local council. Do not allow discharge into neighbouring properties. Roof drainage must discharge to the stormwater system, unless rainwater is being harvested. Complete the final stormwater drainage system before the roof is installed. Connect using either temporary or permanent downpipes

POST-CONSTRUCTION AND EROSION CONTROL

Stabilise the site as soon as possible after construction, or while the last trades are finishing, to minimise the potential for ongoing soil erosion. Turf lawns are commonly used to stabilise soil but their high water consumption can be an environmental burden. Native ground cover plants do the same thing with considerably lower water use. Avoid replacing native vegetation with turf.

Mulch (straw or other material) can be used on open garden beds to protect soil and support plant growth. Mulch spread to a depth of 75-100mm minimises soil and water loss and controls weed growth. Mulch may be less suitable on steep sites and in high wind areas. Temporary, quick germinating grasses such as rye and oats can be used to stabilise soil until slower growing plants can be established. This method is only effective after the grass seeds have germinated and established a root structure.

Semi permeable paving can be used to stabilise areas of the site. Avoid excessive use of hard surfaces that prevent stormwater being absorbed. Biodegradable erosion control mats are useful when revegetating steep slopes.

Integrate landscaping strategy with sediment control. For example, diversion channels and trenches that filter sediment can be used with rubble in the base to create a deep root planting opportunity.

 \mathbf{v}

1. Construct sediment fences as close as possible to being parallel to the contours of the site, but with small returns as shown in the drawing to limit the catchment area of any one section. The catchment area should be small enough to limit water flow if concentrated at one point to 50 litres per second in the design storm event, usually the 10-year event. 2. Cut a 150-mm deep trench along the upslope line of the fence for the bottom of the fabric to

be entrenched. 3. Drive 1.5 metre long star pickets into ground at 2.5 metre intervals (max) at the downslope edge of the trench. Ensure any star pickets are fitted with safety caps.

4. Fix self-supporting geotextile to the upslope side of the posts ensuring it goes to the base of the trench. Fix the geotextile with wire ties or as recommended by the manufacturer. Only use geotextile specifically produced for sediment fencing. The use of shade cloth for this purpose is not satisfactory.

5. Join sections of fabric at a support post with a 150-mm overlap. 6. Backfill the trench over the base of the fabric and compact it thoroughly over the geotextile.

PRELIMINARIES

All work to comply with the Building Code of Australia, current editions of the relevant Australian Standards, and industry codes of practice.

Select, store, handle and install proprietry products or systems in accordance with the published recommendations of the manufacturer or supplier

Dimensions and Setout

Do not scale from drawings. Take figured dimensions in preference to scale. Verify all dimensions on site before commencing work. The site foreman shall be responsible for verifying all dimensions and levels prior to the commencement of the Works. In the event of discrepancies in the setout of the Works, the builder should refer to the Project Designer for clarification before proceeding.

TERMITE PROTECTION

rmite protection to AS3660.1. Use a physical barrier system installed by licensed installers to manufacturer's specification. Obtain all relevant certification from licensed installers to the effect that these works have been executed in accordance with the BCA, Aust. Stds and relevant codes of practice.

SITE PREPARATION

Groundworks for slabs and footings to AS2870.

Demolition to AS2601. Avoid erosion, contamination and sedimentation of the site, surrounding areas and drainage systems. Limit clearing of the Site to areas to be occupied by the Works, paving and landscaping. Grub out or grind stumps of all trees to be removed from the site.

EXCAVATION

Excavate to give the levels and profiles required for construction, site services, paving and landscaping. Allow for compaction and settlement. Confirm bearing capacity for foundations is adequate. Provide even bearing surfaces for load-bearing elements including footings. Grade to ground surface externally to drain ground or surface water away from the buildings without ponding. Remove all loose material, debris and organic matter prior to placing fill, ground slabs and load-bearing elements. Compact the ground to achieve required density.

VAPOUR BARRIERS

All vapour barriers to AS2870. Provide vapour barriers below all around concrete slabs (if required) on sand blind surface sufficient to cover hard projections. Barriers to be minimum 0.2mm thick impact resistant polyethylene film. Provide ant-caps between any brick or stone piers and sub walls and timber bearers.

SERVICE TRENCHES

Excavate trenches as required to bring all services to the Works. Trenches to be straight between manholes, inspection points and junctions where practicable, of minimum depth required to adequately accommodate relevant service. Obtain inspection approvals where relevant prior to backfilling. Backfilling to be compacted to prevent subsidence.

CONCRETE CONSTRUCTION

Concrete structures generally to AS3600. Ground slabs and footings to AS2870. Ready-mixed concrete to A\$1379. All reinforcement to be in accordance with Engineer's drawings and specification. Place all concrete uniformly over the width of the slab to achieve a level face. Provide construction joints as required. Compaction, curing and formwork stripping to comply with Aust. Stds and codes of practice.

TIMBER AND STEEL CONSTRUCTION

All timber framing and flooring to A\$1684, A\$1720.1 where relevant. Structural steelwork to A\$4100. Preparation of metal surfaces to A\$1627. Flashing and damp-proof courses to AS2904

DOORS AND WINDOWS

All doors and windows generally to AS2047.1 as per door and window schedule. To match existing upvc system throughout. Reuse existing doors and windows as

denoted on the drawings

Install flashings, weather-bars, drips, storm moulds etc. to prevent water entering building between frames and the building structure. Install all door and window sets plumb, level, straight and true, adequately anchored and free of building loads and structural deflection.

LININGS

All plasterboard linings to A\$2588, 13mm thick sheets to ceilings, 10mm thick sheets to walls. Moisture resistant plasterboard to be used in all wet areas All fibre cement linings to AS2908.2, walls - 9mm-thick sheets, suspended soffits -9mm-thick sheets, floors - 18mm thick sheets. All installation to A\$2589.1. Linings to be fixed to framing at recommended

spacing. Ensure all linings are level, plumb, straight and true as applicable. Provide recessed edge sheets and finish flush with perforated reinforcing tape. Provide flashings, trim and sealants to effectively waterproof wet areas. Provide timber trim as detailed and where necessary to make neat junctions between components and finishes. Provide Rondo stopping bead profile to ceiling planes.

WATERPROOFING AND WET AREAS

All waterproofing to A\$3740. All liquid and sheet membrane systems to be specific for their intended purpose, installed to manufacturer's specification, properly and effectively terminated at perimeters and drainage outlets. Provide certification by a credited certifier for waterproofing works prior to executing subsequent stages of Works. Provide a written guarantee for all waterproofing membranes of not less than 12 years

TILING

All tiles to be cut to fit neatly around fixtures and fittings and at perimeters. Drill holes with damaging tile faces. Return tiles into sills, reveals, and opening. Butt up to returns, frames, fittings and other finishes. Distribute variations in hue, colour and pattern uniformly by mixing tiles or tile batches before laying.
