RE: DA2021/1612 - 1 Clarke Street NARRABEEN NSW 2101

The current design doesn't appear to have had meaningful input from coastal geomorphologists who would take into account the processes of storms, sand transport, inter-tidal zones, and straight hard surfaces (such as a long concrete sea wall) on the whole beach ecosystem. Not to mention the what the impacts of climate change such as increased severe weather events will have. Otherwise this design which may very well ruin the stretch of beach would not have been undertaken. I request that a group of such experts is consulted with urgently before the wall is completed.
